

You will be provided with a json file that contains a list of people who all belong to the same family tree. Each user can have the following fields:

```
{
  "name": "Susan",
  "mother": "Mary",
  "father": "Dean",
  "gender": "Female",
  "spouse": "Gary" //optional
}
```

We'd like to write some javascript code that enables users to ask specific questions about the data in this file. Please timebox this exercise to an hour.

Instructions:

- Write code to parse the json file
- Create the following:
  - Create a function that given a name of a person will return a list of that person's siblings
  - Create a function that given a name of a person will return the number of descendants
- Create README to show how to run your code
- Zip up your code and email it back to Arthur AI
